

Pinnacle™

HydroLoc QS

Pinnacle HydroLoc QS encapsulates each seed in a carefully formulated mix of minerals and selected micro-nutrients including Fe, Zn and Mg, thus establishing a micro-environment for stimulating vigorous growth in young seedlings. HydroLoc's Hydration Polymer retains water for enhanced germination, growth, and maximizes uptake of micro-nutrients. The hygroscopic nature of the coating pulls and holds moisture to the seed, aiding germination.

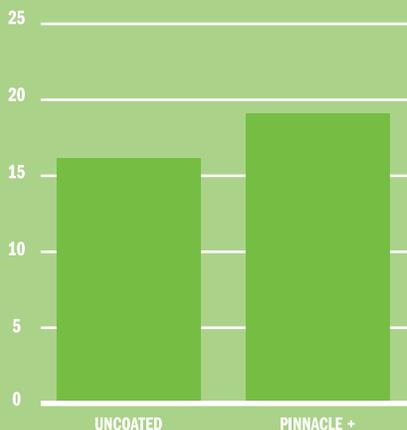

Pinnacle HydroLoc QS requires no increase in seeding rates due to increased number of healthy adult plants when compared to raw seed. Additionally, species such as perennial ryegrass maintain health while allowing other mix species such as kentucky bluegrass or fescues to compete properly.

- **Increase water uptake 3X more than raw seed**
- **Increased seed and seedling survival = no increase in seeding rate!**
- **Achieves better seed to soil contact to aid germination**
- **Increases stand & survival under adverse conditions**

ADDED WEIGHT FROM COATING MATERIAL:

- **Makes seed larger & easier to handle & distribute evenly**
- **Less puddling of seed – seed stays put in over watering conditions**
- **Penetrates stubble or thatch for better seed to soil contact**
- **Increases spread width up to 40 %**
